

## THE INTEGRATION OF IFC IN SAFI

The integration of IFC in SAFI enables importation of models from a large number of architectural and structural software. This new import mode is accessible to the user via the menu: *File* → *Import/Export* → *Import IFC...*

## WHAT IS IFC?

IFC (*Industry Foundation Classes*) is an open and neutral data format allowing the definition of related classes to all construction objects. It is dedicated to the building sector and aims to software interoperability (all editors, all applications). IFC is the most widely used protocol for information exchange and sharing between different platforms of BIM (*Building Information Modeling*).
